Subject:	Application for the Post of Software Developer

Dear Hiring Manager,

I am writing to apply for the position of **Software Developer** at Infosys Limited. I came across this vacancy through the Naukri.com job portal and I am very keen to be considered for the role.

I hold a Bachelor of Technology degree in Computer Science from P P Savani University, where I graduated with a first-class result. During my studies, I gained strong knowledge of Java, Python, and web development technologies. I also completed a six-month internship at TechSolutions Pvt. Ltd., where I contributed to building and testing software applications.

I am a dedicated, detail-oriented, and quick-learning professional. I work well both independently and as part of a team. I believe my academic background and hands-on internship experience make me a suitable candidate for this role at your esteemed organisation.

I would welcome the opportunity to discuss my application further at your convenience. I have attached my resume for your kind consideration. Thank you for taking the time to review my application.

Yours sincerely,

Priya Sharma

Task 2 – Agree or Disagree Essay

"College education should focus more on practical skills than theory."

Position: I Agree

Introduction

In today's fast-moving world, the purpose of a college education is not only to gain bookish knowledge but also to prepare students for real working life. I strongly agree that college education should focus more on practical skills than on theory. When students learn how to actually do things — not just read about them — they become more confident, more capable, and more employable.

Body Paragraph 1 – Practical Skills Prepare Students for Real Jobs

The most important reason to focus on practical skills is that employers today want candidates who can work from day one. Theoretical knowledge alone does not prepare a student for the challenges of a real workplace. For example, a student studying computer science may understand programming theory very well, but if they have never written or tested actual code on a real project, they will struggle in a job interview or on the job. Many companies, such as Google and Infosys, now prefer candidates who have hands-on project experience over those with only high marks in theory exams. Practical training — such as internships, lab work, and live projects — builds the kind of confidence and skill that textbooks simply cannot provide.

Body Paragraph 2 – Practical Learning Improves Understanding

Another strong reason is that students understand and remember lessons far better when they can apply them in real situations. When a student only reads about a topic, it can feel abstract and difficult to connect with. However, when they actually perform the task — such as conducting a chemistry experiment, preparing a business plan, or coding a mobile application — the learning becomes deep and lasting. For instance, medical students who practise on simulation models or real patients during their training become far more competent doctors than those who only study from books. Practical exposure makes education meaningful and enjoyable, which also reduces student dropout rates.

Body Paragraph 3 – Addressing the Importance of Theory

Some people argue that theory is the foundation of all knowledge and should not be reduced. This is a fair point, as theory provides the rules and principles that guide practical work. However, the issue is not about removing theory entirely but about finding a better balance. Currently, many college programmes are heavily theory-based, leaving students with little time for skill development. A blended approach — where theory is taught alongside practical application — would serve students far better. Countries like Germany

and Singapore have already adopted this model in their education systems and have seen excellent results in graduate employability.

Conclusion

In conclusion, I firmly believe that colleges should give greater importance to practical skills while still maintaining a solid theoretical base. Practical education produces graduates who are job-ready, skilled, and self-reliant. As the world of work continues to change rapidly, it is essential that our education system evolves with it. A student who can both think and do is truly prepared for the future.
